

Progress note (what works right now):

The Student/Course Tracker currently supports a text-based menu with three options: add a new student, list all students, and exit. Adding a student prompts for name, ID, course, and GPA, builds a `Student` object from that input, and stores it in an `ArrayList<Student>`. Listing prints every stored student in a readable, one-line format. Input is validated so non-numeric entries for ID/GPA won't crash the program. Two starter students (Ava Thompson, Marcus Lee) are hardcoded on launch so the list function has visible data immediately — this was optional per the assignment guidance.

What's reasonably "in the works" next, if you want to keep building on this milestone:

- **Edit/delete** — a menu option to update a student's GPA or course, or remove a student by ID.
- **Search/filter** — find a student by ID or name, or list all students in a given course (the assignment explicitly says to hold off on this until add/list is stable, which it now is).
- **A real course class** — right now "course" is just a string field on `Student`s. Splitting it into its own class (with a course code, credit hours, instructor) would let you model enrollment as a relationship instead of a label — more realistic for a Student/Course domain.
- **Save/load** — persist the `ArrayList` to a text or CSV file so data survives between runs, instead of resetting to the two hardcoded students each time.
- **Input constraints** — e.g., rejecting GPA values outside 0.0–4.0, or duplicate student IDs.
